

Condensation

The process where water vapor changes back into a liquid, especially in the clouds

Precipitation

The process where the liquid in heavy dark clouds becomes too heavy and fall to the earth as rain, sleet, snow, or hail

Transpiration

The process where water vapor is released from plants/trees and rises into the air

Evaporation

The process where liquid changes to water vapor and rises in the air.

The two main causes of nitrogen being fixed to use

Bacteria and Lightening

Most nitrogen fixation is done by

Bacteria

Bacteria is most important in the process of

Nitrogen Fixation

Nitrogen in the form of gas can be used directly by some kinds of

Bacteria

Burning gas in an automobile is a type of

combustion

The processes that releases carbon dioxide into the environment

Combustion, Respiration & Decompostion

Animals get the carbon they need by

eating plants

Clouds form though the process of

Condensation

Respiration

The process where sugar is broken down, uses sugar, and CO₂ is released

Photosynthesis

The process where plants take in CO₂, Sunlight, and Water to make Glucose

Decomposition

The process where decomposers break down dead materials and release Carbon to the soil
